## -- 问题: 编写一个存储过程, 向book表中添加书籍信息?

-- 创建表
create table book (bookld number,bookName varchar2(50),publishHouse varchar2(50))
-- 编写存储过程
create or replace procedure sp\_pro7(spbookld in number,spbookName in varchar2,sppublishHouse in varchar2) is begin insert into book values (spbookld,spbookName,sppublishHouse); end;
-- 调用存储过程 exec sp\_pro7('0070','Python编程','社会出版社');

## --问题:编写一个存储过程,输入表名,每页显示记录数、当前页,返回总记录数、总页数和结果集

```
--定义sql语句 字符串
v sql varchar2(1000);
 一定义两个整数
v begin number:=(pageNow-1)*Pagesize+1;
v_end number:=pageNow*Pagesize;
begin
--执行部分
v_sql:='select * from (select t1.*,rownum rn from (select * from '|| tableName
||') tl where rownum<='||v end||') where rn>='||v begin;
--把游标和sql关联
open p cursor for v sql;
--計算myrows和myPageCount
--组织一个sql
v_sql:='select count(*) from '||tableName;
--执行sql, 并把返回的值,赋给myrows;
execute immediate v sql into myrows;
--計算myPageCount
if mod(myrows, Pagesize) = 0 then
myPageCount=myrows/Pagesize;
else
myPageCount=myrows/Pagesize+1;
end if;
end;
```
